-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE <u>3</u> MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1)☒ Responsive to communication(s) filed on *15 November 2004*.

2a)☐ This action is **FINAL.**   2b)☒ This action is non-final.

3)☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4)☒ Claim(s) *1,2,4-11 and 13-81* is/are pending in the application.

   4a) Of the above claim(s) _____ is/are withdrawn from consideration.

5)☐ Claim(s) _____ is/are allowed.

6)☒ Claim(s) *1,2,4,5,7-11,13,14,17-23,25-33,35-48,50-63 and 65-81* is/are rejected.

7)☒ Claim(s) *6,15,16,24,34,49 and 64* is/are objected to.

8)☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9)☐ The specification is objected to by the Examiner.

10)☐ The drawing(s) filed on _____ is/are: a)☐ accepted or b)☐ objected to by the Examiner.

   Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).

   Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

11)☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

12)☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

   a)☐ All   b)☐ Some * c)☐ None of:

   1.☐ Certified copies of the priority documents have been received.

   2.☐ Certified copies of the priority documents have been received in Application No. _____.

   3.☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

   * See the attached detailed Office action for a list of the certified copies not received.

6)☐ Other: _____.

DETAILED ACTION

1.   Applicants' arguments in appeal brief filed November 15, 2004 have been fully

considered but they are not persuasive. However, in further review of the Claims, it has

been concluded that prior arts of record do not expressly teach the limitations recited in

Claims 6, 15, 16, 34, and these claims are allowable over prior arts of record.

Consequently, the Finality of Office Action has been withdrawn.

2.   Concerning Claims 1, 2, 9, 10, 11, 13-18 and 29-36, Applicants argue in essence

that prior art of record (Granfors et al., Granfors hereinafter) does not teach the array

includes "each surrounding neighboring pixels of the defective pixel as additional matrix

elements." Fundamentally, a matrix is identified by its dimensions, e.g., M x N matrix,

wherein either M or N may be equal to 1 (i.e., a one-dimensional matrix).

        MPEP § 2111, under the heading "Claims Must be Given Their Broadest

Reasonable Interpretation," states that "reading a claim in light of the specification, to

thereby interpret limitations explicitly recited in the claim, is a quite different thing from

'reading limitations of the specification into a claim', to thereby narrow the scope of the

claim by implicitly adding disclosed limitations which have no express basis in the

claim."

        Claim language does not recite the dimension of the matrix. Accordingly, any

row or column of the matrix shown on Figure 3 that has pixel 34 as the center element

meets the claimed language. Applicants may not read a 3 x 3 matrix from the

specification into the claims without explicitly reciting the dimensions of the matrix.

A one-dimensional array of 1x3 as taught by Granfors et al also has the defective pixel as a center matrix element and each surrounding neighboring pixel of the defective pixel as additional matrix element (in this case two pixels). If the claimed invention requires a two-dimensional matrix, it should be explicitly recited in the claims.

Arguments analogous to those mentioned above for Claim 1 are applicable to Claims 10 and 29, and the claims depending from Claims 1, 10 and 29.

3.   Regarding Claim 5, 14, 23, 33, 50, 65, and 78, Granfors discloses that the correction value includes a linear interpolation (averaging) of pixel values corresponding to the highest local gradient matrix elements (Column 3, Lines 56-67, Column 4, Lines 1-65). Bad pixels (pixels whose intensity values are substantially different from the neighboring pixels) are those pixels that result in determination that they have the highest gradients between their intensity values and the intensities of their neighboring pixels. Considering the fact that a matrix of 1x3 elements will also meet the claimed language, the two neighboring pixels of the center pixel will have the highest local gradient. Consequently, the pixels in vicinity of the defective pixels will generate highest local gradient matrix elements.

Arguments analogous to those mentioned above for Claim 5 are applicable to Claims 7, 16, 25 and 35.

4.   Regarding Claim 8, 27, 28, 36, 46, 61, and 79, the Examiner had referred to the teachings of Granfors in Column 4, Lines 47-53, while the Applicants' arguments are based on a separate concept indicated in Column 4, Lines 54-67. As it was indicated in the previous Office actions, Granfors discloses "replacing the defective pixel with a

temporary value based on a linear interpolation of surrounding neighborhood pixels before the determining step (a) such that determining the local gradient comprises determining the local gradient using the temporary value of the defective pixel" (Column 4, Lines 47-53). The temporary value is the result of linear interpolation of first combination ((E+W)/2), if the new value were also bad then the next combination would be used. It is obvious that in the first linear interpolation, the bad pixel value should have been replaced by a new value to conclude whether a next interpolation is necessary or not.

Arguments analogous to those mentioned above for Claim 8 are applicable to Claims 27, 28, 36, 46, 61, and 79.

5.   Regarding Claims 19, it is respectfully submitted that a claim is anticipated if each and every element as set forth in the claim is found, either expressly or inherently described, in the prior art reference (MPEP § 2131). Using the "local gradient" identified in the Office Action inherently selects the pixels to use to correct the defective pixel.

Argument analogous to those presented for Claims 1, 5 and 19 above, are applicable to Claims 20, 21, 23 and 26-28.

6.   Regarding Applicants' arguments concerning Claims 37-43, the Examiner maintains the previous response to Applicants' arguments and indicates that "global characteristics of pixels (whether in proximity to the defective pixel or anywhere in the image) is the intensity value of the pixels as is well known in the art, and further recited in the claims dependent to Claim 37. As discussed in the Examiner's response to Applicants' arguments (Items A. through D.), Granfors teaches, "Correcting the

defective pixels based on the intensity value (global characteristics) of the neighboring

pixels of the defective pixel (This is the well known and indisputable concept routinely

implemented in image processing for correcting defective pixels).

Using larger alternative 5x5 or 7x7 filters are explicitly suggested by Granfors

(Column 4, Lines 1-11), utilizing an exemplary smaller size kernel of 3x3 by Granfors,

does not mean that the prior art excludes the use of these larger alternative 5x5 or 7x7

filters. There is no citation in Granfors invention that prohibits the use of suggested 5x5

or larger filters. The same arguments apply to the Schreiner's invention, (U.S.

5,617,461), concerning utilization of 31x31 kernels for correction of defective pixels. It

is unquestionable that Granfors identifies the defective pixel based on the local gradient

of the defective pixel value and neighboring pixels (Column 3, Lines 65-67, Column 4,

Lines 1-11; Figure 3; Column 4, Lines 38-53. A digital image is a two-dimensional array

of pixels comprising of a plurality of one-dimensional array of pixels having the pixel

intensities as a corresponding pixel values. The local gradient matrix is generated from

the convolution of a plurality of filter kernels (one-dimensional or two-dimensional) and

the array of the image pixel values.). The defective pixel values will be inherently

substituted during convolution by local gradient matrix which indicates applying a

correction value to defective pixel value based on the local gradient matrix.

7.   Argument analogous to those presented for Claim 34, are applicable to Claims

38-43.

8.   Regarding Claims 44 and 51-57, as indicated in the rejection of these claims, the

intensity of each pixel is the characteristic being analyzed. The intensity of the center

pixel 34 and the intensities of the other two elements of 1x3 matrices (e.g., E and W) are the first, second and third pixel values (analyzed characteristics) used to provide a pixel value for the defective pixel. In addition, the gradient of the pixels, i.e., the difference in the pixel values of good pixels and bad pixels in median filtering recited in Column 4, Lines 1-11, or the average values of good pixel values recited in Column 4, Lines 38-53, are further characteristics utilized in analysis. It is further submitted that each different image has different pixel values, and therefore, the first, second and third values are inherently different for each image.

Arguments analogous to those mentioned above for Claim 44, are applicable to Claims 51-57.

9.   Concerning Claim 48, Granfors select a pixel based on its gradient to provide a value for the defective pixel (Column 3, Lines 65-67, Column 4, Lines 1-11; Figure 3; Column 4, Lines 38-53. A digital image is a two-dimensional array of pixels comprising of a plurality of one-dimensional array of pixels having the pixel intensities as a corresponding pixel values. The local gradient matrix is generated from the convolution of a plurality of filter kernels (one-dimensional or two-dimensional) and the array of the image pixel values.).

10.   Arguments analogous to those mentioned above are applicable to Claims 59-63 and 65-81. In addition, Applicants are respectfully referred to the detailed rejection of these claims. In particular, concerning Claim 58, it is further submitted that applying Laplacian of a Gaussian filter kernel will undoubtedly analyze the edge strength, as it is well known in the art.

Claim Rejections - 35 USC § 102

11.   The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that

form the basis for the rejections under this section made in this Office action:

> A person shall be entitled to a patent unless –
>
> (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

12.   Claims 1, 2, 5, 8-11, 14, 17-21, 23, 26-31, 33, 36, 44-47, 50-52, 56, 57, 59-62,

65-67, 71, 74 and 75-79 are rejected under 35 U.S.C. 102(b) as being anticipated by

Granfors et al. (U.S. 5,657,400), hereinafter Granfors.

Regarding Claim 1, Granfors discloses a method for correcting a defective pixel

in an image produced by a detector, the image including an array of pixels and the array

of pixels having a corresponding array of pixel values, comprising:

(a) determining a local gradient, the local gradient comprising an array of local

gradient matrix elements (Column 3, Lines 65-67, Column 4, Lines 1-11; Figure 3;

Column 4, Lines 38-53. A digital image is a two-dimensional array of pixels comprising

of a plurality of one-dimensional array of pixels having the pixel intensities as a

corresponding pixel values. The local gradient matrix is generated from the convolution

of a plurality of filter kernels (one-dimensional or two-dimensional) and the array of the

image pixel values.); and

(b) providing a correction value based on the local gradient to correct the

defective pixel (Figure 3; Column 4, Lines 12-53);

wherein at least a portion of the array of pixel values comprises a matrix, and

includes the defective pixel as a center matrix element and each surrounding

neighboring pixel of the defective pixel as additional matrix elements (Figure 3; Column

4, Lines 38-53. The center pixel 34 and its surrounding neighboring pixels "W" and "E"

is a one-dimensional matrix of 1 x m element (e.g., 1 x 3 element) utilized in correcting

the defective pixel value.).

Regarding Claim 2, Granfors further discloses the method of Claim 1, wherein

step (a) of determining a local gradient includes determining the local gradient in part

from a gradient kernel and at least a portion of the array of pixel values (Column 3,

Lines 65-67, Column 4, Lines 1-11; Figure 3; Column 4, Lines 38-53).

Regarding Claim 5, arguments analogous to those presented for Claim 1 is

applicable to Claim 5. Granfors further discloses providing a correction value includes

at least one of a linear interpolation and a weighted average of pixel values

corresponding to the pixels selected based on determination that they had the highest

local gradient (Column 3, Lines 56-67, Column 4, Lines 1-65. Bad pixels are those

pixels that generate highest gradient. Considering the fact that since a matrix of 1x3

elements also meets the claimed language, the two neighboring pixels of the center

pixel will have the highest local gradient.).

Regarding Claim 8, Granfors further discloses the method of Claim 1, further

comprising:

identifying the defective pixel in the image produced by the detector before the

determining step (a) (Column 3, Lines 29-55);

replacing the defective pixel with a temporary value based on a linear

interpolation of surrounding neighborhood pixels before the determining step (a) such

that determining the local gradient comprises determining the local gradient using the temporary value of the defective pixel (Column 4, Lines 47-53. The temporary value is the result of linear interpolation of first combination ((E+W)/2), if the new value were also bad then the next combination would be used. It is obvious that in the first linear interpolation, the bad pixel value should have been replaced by a new value to conclude whether a next interpolation is necessary or not.); and

replacing the defective pixel with the correction value after the providing step (b) (Column 4, Lines 66-67, Column 5, Lines1-7).

Regarding Claim 9, Granfors further discloses the method of Claim 1, further comprising repeating steps (a)-(b) a plurality of times as desired to correct a plurality of defective pixels in the image produced by the detector (Column 4, Lines 12-23).

With regards to Claims 10, 19 and 29, arguments analogous to those presented for Claim 1 are applicable to Claims 10, 19 and 29.

With regards to Claims 11, 20 and 30, arguments analogous to those presented for Claim 2 are applicable to Claims 11, 20 and 30.

With regards to Claims 21 and 31, arguments analogous to those presented for Claim 3 are applicable to Claims 21 and 31.

With regards to Claims 14, 23 and 33, arguments analogous to those presented for Claim 5 are applicable to Claims 14, 23 and 33.

Regarding Claim 17, Granfors further discloses the method of Claim 10, wherein the detector comprises an array of photodetector elements, each photodetector element

configured to convert an impinging photonic energy into an electrical signal proportional thereto (Figure 2B; Column 2, Lines 49-67).

With regards to Claim 18, arguments analogous to those presented for Claim 2 are applicable to Claim 18.

Regarding Claim 26, Granfors further discloses the system of Claim 19, wherein the means for determining and the means for providing include determining the local gradient and generating the correction value, respectively, for each of a plurality of defective pixels in the image produced by the detector (Column 4, Lines 12-65).

With regards to Claim 27, arguments analogous to those presented for Claim 8 are applicable to Claim 27.

Regarding Claim 28, Granfors further discloses the system of Claim 27, wherein the means for replacing includes at least one of replacing the defective pixel with the correction value, and storing the correction value with an identifying link to the defective pixel in a storage device (Column 4, Lines 54-65).

With regards to Claim 36, arguments analogous to those presented for Claim 8 are applicable to Claim 36.

Regarding Claim 44, Granfors discloses a method for correcting a defective pixel in an image produced by a digital detector having a defective input at the defective pixel, the image including an array of pixels and the pixels having corresponding pixel values, the method comprising:

analyzing a characteristic of each of a plurality of pixels (Column 1, Lines 48-52. The intensity of each pixel is the characteristic being analyzed. In addition, the gradient

of the pixels, i.e., the difference in the pixel values of good pixels and bad pixels in

median filtering recited in Column 4, Lines 1-11, or the average values of good pixel

values recited in Column 4, Lines 38-53, are further characteristics utilized in analysis.);

selecting a first pixel of the plurality of pixels having a first pixel value based on

the analyzed characteristic of the first pixel (Figure 3, pixel E or any of the pixels

surrounding pixel 34);

selecting a second pixel of the plurality of pixels having a second pixel value

based on the analyzed characteristic of the second pixel (Figure 3, pixel W or any of the

pixels surrounding pixel 34 except for pixel E);

selecting a third pixel of the plurality of pixels having a third pixel value based on

the analyzed characteristic of the third pixel (Figure 3, pixel N or any of the pixels

surrounding pixel 34 except for pixels E and W); and

providing a pixel value for the defective pixel using the first, second, and third

pixel values (Column 4, Lines 38-65. The values of first to eighth neighboring pixels are

utilized for providing a pixel value for the defective pixel. The broad claim language

does not recite a particular combination of the three pixel values simultaneously.).

Regarding Claim 45, Granfors discloses the method of Claim 44, wherein the

characteristic analyzed comprises a gradient of each of the plurality of pixels (Column 4,

Lines 1-11 and 38-53).

Regarding Claim 46, Granfors discloses method of Claim 45, wherein

determining the gradient for each pixel includes temporarily replacing the pixel value of

the defective pixel with a calculated pixel value (Column 4, Lines 1-11 and 38-53).

Regarding Claim 47, Granfors further discloses the method of Claim 45, wherein the provided pixel value comprises a linear average of pixel values from pixels that are not defective (Column 4, Lines 38-53).

With regards to Claim 50, arguments analogous to those presented for Claim 5 are applicable to Claim 50.

Regarding Claim 51, Granfors further discloses the method of Claim 44, wherein providing a pixel value for the defective pixel using the first, second, and third pixel values comprises averaging the pixel values used to provide a pixel value for the value of the defective pixel (Column 4, Lines 38-53).

Regarding Claim 52, Granfors further discloses the method of Claim 51, wherein averaging the pixels values comprises using a linear average of the pixel values (Column 4, Lines 38-53).

Regarding Claim 56, Granfors further discloses the method of Claim 44, wherein the first, second, and third pixels are further selected based on whether they bolder the defective pixel in the array of pixels (Column 4, Lines 38-53).

Regarding Claim 57, Granfors further discloses the method of Claim 44, wherein the analyzed characteristic of the plurality of pixels is calculated based on pixel values of the pixels (Column 4, Lines 38-53).

Claims 59-62 and 65-67 recite broader limitations of Claims 44-47 and 50-52, respectively. Therefore, arguments analogous to those presented for Claims 44-47 and 50-52 are applicable to Claims 59-62 and 65-67.

With regards to Claim 71, arguments analogous to those presented for Claim 56 are applicable to Claim 71.

Regarding Claim 74, Granfors further discloses the method of Claim 59, further comprising repeating a process of analyzing a characteristic of each of a plurality of pixels, the characteristic for each of the plurality of pixels based on pixel values; selecting a first pixel of the plurality of pixels having a first pixel value based on the analyzed characteristic of the first pixel; selecting a second pixel of the plurality of pixels having a second pixel value based on the analyzed characteristic of the second pixel; and providing a pixel value for the defective pixel using the first and second pixel values for each of the defective pixels of the digital detector (Column 4, Lines 1-53).

Regarding Claim 75, Granfors further discloses the method of Claim 59, further comprising determining which pixels of the digital detector are defective before an image to be corrected is received from the digital detector (Column 3, Lines 29-55).

With regards to Claims 76 and 77, arguments analogous to those presented for Claim 1 are applicable to Claims 76 and 77.

With regards to Claim 78, arguments analogous to those presented for Claim 5 are applicable to Claim 78.

With regards to Claim 79, arguments analogous to those presented for Claim 8 are applicable to Claim 79.

Claim Rejections - 35 USC § 103

13. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

14.   Claims 4, 13, 22, 32, 37-43, 48, 63, 73, 80 and 81 are rejected under 35 U.S.C.

103(a) as being unpatentable over Granfors (U.S. 5,657,400).

Regarding Claim 4, Granfors further discloses the method of Claim 2, further

comprising:

selecting a matrix size of the at least a portion of the array of pixel values

(Portion of the digital image corresponding to array of elements 22 shown on Figure

2B); and

selecting the gradient kernel (Column 4, Lines 1-5).

Granfors suggests applying filters with suitably small kernels (e.g., 5x5) to the

image (Column 3, Lines 65-67, Column 4, Lines 1-11) but does not explicitly disclose

the gradient filter is selected from a group including a Laplacian of a Gaussian filter

kernel, a Roberts gradient kernel, a Prewitt gradient kernel, and a Sobel gradient kernel.

Laplacian of a Gaussian filter kernel, Roberts gradient kernel, Prewitt gradient

kernel, and Sobel gradient kernel are well known filters conventionally implemented in

image processing for filtering images (Official Notice).

It would have been obvious to a person of ordinary skill in the art at the time the

invention was made to select the gradient kernel from a group including a Laplacian of a

Gaussian filter kernel, a Roberts gradient kernel, a Prewitt gradient kernel, and a Sobel

gradient kernel because these are the well known filter kernels conventionally utilized in

image processing for filtering purposes to identify pixel gradients in the image and detect the edges to enhance digital images.

With regards to Claims 13, 22, 32, 48 and 63 arguments analogous to those presented for Claim 4 are applicable to Claims 13, 22, 32, 48 and 63.

With regards to Claim 37, arguments analogous to those presented for Claim 1 are applicable to Claim 37. Global characteristic is the gradients of the pixels, or the intensities of pixels.

With regards to Claims 39 and 40, arguments analogous to those presented for Claim 1 are applicable to Claims 39 and 40.

With regards to Claims 38 and 41-43, 5 x 5 and 7 x 7 filter kernels suggested by Granfors are well-known filters conventionally implemented in image processing for filtering images (Official Notice).

It would have been obvious to a person of ordinary skill in the art at the time the invention was made to select the 5 x 5 and 7 x 7 gradient kernels because these are the well known filter kernels conventionally utilized in image processing for filtering purposes to detect and enhance the features in digital images.

Regarding Claim 73, Granfors further disclose providing the image data to a user, wherein the image data comprises the first pixel value, the second pixel value, and the pixel value provided for the defective pixel (Column 4, Lines 38-53), but does not disclose displaying these data.

Displaying data is extremely well known in the art (Official Notice).

It would have been obvious to a person of ordinary skill in the art at the time the
invention was made to display image data comprising the first pixel value, the second
pixel value, and the pixel value provided for the defective pixel because it is a
conventional method for presenting the data routinely implemented in the art of image
processing.

15.   Claims 7, 16, 25, 35, 53-55, 58, 68-70 and 72 are rejected under 35 U.S.C.
103(a) as being unpatentable over Granfors (U.S. 5,657,400) in view of Watanabe et al
(U.S. 5,854,655), hereinafter Watanabe.

Regarding Claim 53, Granfors does not disclose the method of Claim 51, wherein
averaging the pixels values comprises using a weighted average of the pixel values.

Watanabe discloses a defective pixel detecting system using a weighted average
of the pixel values for providing a pixel value for the defective pixel (Figure 7; Column
14, Lines 17-67, Formula (5)).

It would have been obvious to a person of ordinary skill in the art at the time the
invention was made to modify Granfors invention according to the teachings of
Watanabe to use a weighted average of the pixel values for providing a pixel value for
the defective pixel because it will increase the reliability of the correction system and will
provide more accurate results.

Regarding Claim 54, Watanabe further discloses the method of Claim 53,
wherein a weight assigned to each pixel value used to provide the pixel value of the
defective pixel is based on a characteristic used to select the pixel to be used to provide
a value for the defective pixel (Figure 7; Column 14, Lines 17-67, Formula (5)).

Regarding Claim 55, Watanabe further discloses the method of Claim 53, wherein a weight assigned to each pixel value used to provide the pixel value of the defective pixel is based on a proximity of the pixel to be used to provide a value for the defective pixel to the defective pixel (Figure 7; Column 14, Lines 17-67, Formula (5)).

Regarding Claim 58, Watanabe further discloses the method of Claim 44, wherein the characteristic analyzed comprises a characteristic selected from a group consisting of edge strength, gradient strength, and image feature strength (Column 6, Lines 49-67, Column 7, Lines 1-25. Image feature strength based on the pixel intensities is the analyzed characteristic.).

It would have been obvious to a person of ordinary skill in the art at the time the invention was made to modify Granfors invention according to the teachings of Watanabe to use image feature strength as an analyzed characteristic because it will increase the reliability of the correction system and will provide more accurate results.

Regarding Claim 58, it is further submitted that the results of the applied filtering by prior arts of record are the edge and gradient strength, which are further utilized in defective pixel correction procedure.

With regards to Claim 7, arguments analogous to those presented for Claims 6 and 58 are applicable to Claim 7.

With regards to Claims 16, 25 and 35, arguments analogous to those presented for Claim 7 are applicable to Claims 16, 25 and 35.

With regards to Claims 68-70, arguments analogous to those presented for Claims 53-55 are applicable to Claims 68-70, respectively.

With regards to Claim 72, arguments analogous to those presented for Claim 58 are applicable to Claim 72.

Regarding Claim 80, Granfors et al further disclose generating correction codes for bad pixels. The correction codes are stored in a pixel correction memory, and the correction code for each pixel is read during imaging (Column 2, Lines 2-16; Column 4, Lines 54-67, Column 5, Lines 1-7).

It would have been obvious to a person of ordinary skill in the art at the time the invention was made to implement Granfors et al teachings for a plurality of input images to encompass Claim 80 limitations because it is an standard repetitive methodology to perform same image processing functions for different images.

Regarding Claim 81, it is obvious that characteristics of the first and second images comprise image features of the first and second image. In the simplest circumstance, based on a reasonable logical interpretation, these features could be the intensity values of the pixels in the first and second images. Not recited in the claims, these features might be

Allowable Subject Matter

16.   Claims 6, 15, 16, 24 and 34 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Claim 6 of the instant invention recite the method of Claim 5, wherein highest local gradient matrix elements includes at least three highest local gradient matrix elements.

Claims 15, 24 and 34, recite similar limitations and are therefore allowable.

Claim 16 depends on Claim 15 and is therefore allowable.

17.   Claims 49 and 64 are objected to as being dependent upon a rejected base

claim, but would be allowable if rewritten in independent form including all of the

limitations of the base claim and any intervening claims.

Claim 49 of the instant application recites the method of Claim 45, wherein the gradient

for each pixel is determined by G_i = SQRT $((A_i * H)^2 + (A_i * (-H))^2)$ where A_i is a matrix of

pixel values comprising the image and H is a gradient kernel matrix.

Claim 64 of the instant application recites the method of Claim 60, wherein the

gradient for the first and second pixels are determined by applying

G_i = SQRT $((A_i * H)^2 + (A_i * (-H))^2)$ where A_i is a matrix of pixel values comprising the

image and H is a gradient kernel matrix.

Contact Information

19.   Any inquiry concerning this communication or earlier communications from the

examiner should be directed to Mehrdad Dastouri whose telephone number is (703)

305-2438. The examiner can normally be reached on Monday to Friday from 8:00 a.m.

to 4:30 p.m..

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Amelia Au can be reached on (703) 308-6604. The fax phone number for

the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the

Patent Application Information Retrieval (PAIR) system. Status information for

published applications may be obtained from either Private PAIR or Public PAIR.

Status information for unpublished applications is available through Private PAIR only.

For more information about the PAIR system, see http://pair-direct.uspto.gov. Should

you have questions on access to the Private PAIR system, contact the Electronic

Business Center (EBC) at 866-217-9197 (toll-free).
